

Concerned about climate change? Do you return your printer cartridges for recycling?

**This is a recycled
printer cartridge.**

It takes 3 litres of oil to
manufacture one new
laser cartridge!

You may be surprised to learn that **recycling a cartridge** does not mean using it again. It **means crushing it up**. The material is mixed with a cocktail of additives to make secondary products like road barriers. This is down-cycling the cartridge into a product that will still eventually end up in landfill.

**Waste of non-renewable resources.
Negative impact on the environment.**

It takes about 3 litres of oil and vast amounts

of power and water and to make a new laser cartridge. Why waste these valuable resources? **There is a better way.**

RE-USE is the most responsible environmental choice.

By re-using a laser cartridge, the non-renewable material is not wasted and much less power and water is used.
